

CHARME INTERNATIONAL
ArteStylo® pigments
Warnings and Components

Product for dermopigmentation: PROFESSIONAL USE ONLY.

Composition: Iron oxides with or without Titanium Dioxide in a Glycerin base.

Contents: 15 ml

Recommended use:

- Prepare the area to be pigmented in adequate sterile conditions. Disinfect the specific area with a recommended antiseptic product.
- Deposit the desired amount of product in an individual sterile and disposable container. When finished, dispose the container and any residue following the current norms for the elimination of residues
- With a disposable and sterile needle, implant the product.
- The professional applying the product must wear surgical type gloves and use adequate eye and clothes protection

Precautions: One will always perform prior to the procedure anti-allergic tests on the skin for each of the products that will be utilized by the qualified professional.

Warnings:

- Do not introduce the needle in the inside of the pigment bottle.
- Do not utilize the leftover product from the container not even for the same client.
- Utilize sterile and disposable single use needles.
- Do not inhale or ingest the product.
- Do not alter the contents of the product.
- Maintain the product on an adequate environment to maintain sterile conditions.
- After the dermopigmentation procedure, the client will not disturb the implanted area.
- After the dermopigmentation procedure, the client should not apply conventional make up of any kind in the pigmented area for at least 8 days after the procedure.
- The client will follow the suggested pre and post procedure recommendations supplied by the professional doing the dermopigmentation procedure.

Recommendations:

- Special care must be taken for persons with the following conditions: diabetics, those with immunological weakness, problems with healing, pregnant, hemophilic or ocular problems. Consult the client's physician
- It is recommended that the application of the product be avoided on persons affected with yeast infection, dermatitis, edemas, burns, keloids, edemas, burns, scars not stabilized, skin cancer, eczema, psoriasis, local inflammation or allergic reactions. Consult the client's physician
- The physical and mental health of the client must be adequate before the implantation.
- The environment where the dermopigmentation procedure is to be done should be clean and sterile.
- In case of intoxication or accidental ingestion, contact the local medical service

Duration of the implanted product:

Generally, it is between 1-3 years and depending on the life style of the individual, if the person sunbathes, medicines taken, if the skin is treated with exfoliates, glycolic acid, etc.

Elimination of the product: If the product is to be removed, go to a medical doctor specialized on the matter. It could be removed by surgical means or laser. There are in the market some products called "removers" but these only lighten the pigment.

Conditions to maintain the product sterile: Maintain the product closed in its original bottle in a cool and dry environment.
